

MoCA (Montreal Cognitive Assessment)

THE MONTREAL COGNITIVE ASSESSMENT IS AN INTERNATIONALLY RECOGNIZED TEST THAT TAKES ABOUT 20 MINUTES TO COMPLETE. IT HELPS OUR PHYSICIANS AND NURSES TO DETECT COGNITIVE IMPAIRMENTS.

- Dementia
- Alzheimer's
- Parkinson's disease
- ALS
- Concussions
- Other Cognitive impairments

APC is excited to announce that as of August 1st, 2019 our entire nursing team and physicians are certified in The Montreal Cognitive Assessment (MoCA).

This test helps our nurses and physicians diagnose impairments and ailments, such as, dementia, Alzheimer's, Parkinson's, ALS and many others at an early stage.

The MoCA test has also been utilized recently to detect cognitive abnormalities in athletes, particularly those participating in physical/contact sports that may be prone to concussions. In fact, a study by the Sport Medicine Clinic at the University of Calgary found that athletes participating in physical/contact sports scored significantly lower than those playing non-contact sports. (details for this study can be found at <https://bjsm.bmj.com/content/47/5/e1.4>)

If you're interested in more information on the MoCA test, please visit www.mocatest.org for further details.

What Does the Montreal Cognitive Assessment Evaluate?

The MoCA assesses cognitive abilities, including:
